Art Unit: 1742

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

3. Claims 1-48 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fang et al. '382.

Fang et al. '382 disclose the invention substantially as claimed. Fang et al. '382 disclose a cermet material comprising :

a WC hard phase; and

a binder phase of Fe-Ni-Co alloys (col. 7, line 8-13).

Fang et al. '382 disclose that the binder phase have a low coefficient of thermal expansion (CTE) of less than 8um/m-K.

Art Unit: 1742

Thus, Fang et al. '382 discloses that the CTE is a effective variable within the invention that is modified based on the desired toughness of the material.

Fang et al. '382 further disclose wherein the hard phase can comprise other carbides with the WC including TiC (col. 8, line 21-29).

Fang et al. '382 further disclose that the material be used in forming a cutting element. The determination of the ratio of the binder phase materials would be determined by one of ordinary skill through routine experimentation based on the specific selection of hard phase material and the desired toughness of the final material.
